## Overview

Introducing the Sonus faber app, included in Maserati Grecale, MC20, and GranTurismo models. This app is a unique feature that enhances your listening experience and allows you to customize your sound. In the following slides, we'll explain all the functionalities that come with the Sonus faber app.

There is no need for the user to download any app in their smartphone. Everything is included in the car's infotainment.

Audio Settings

# Main Menu

Overview

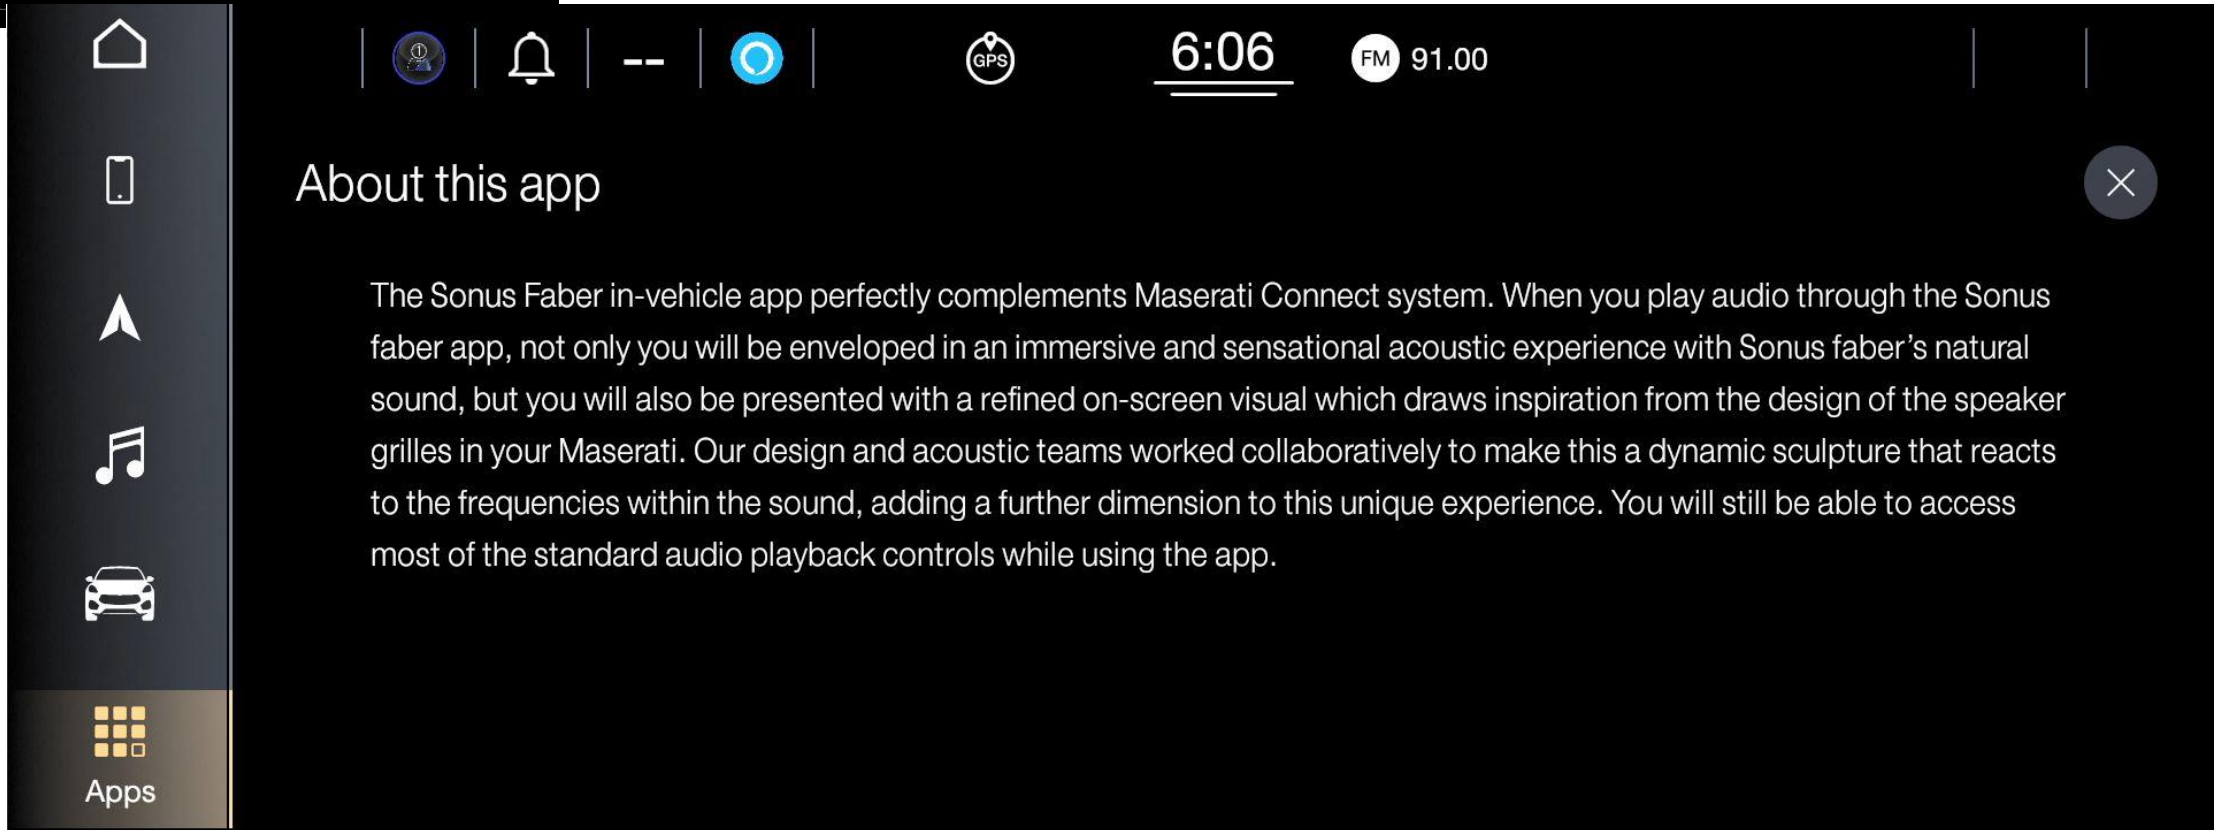

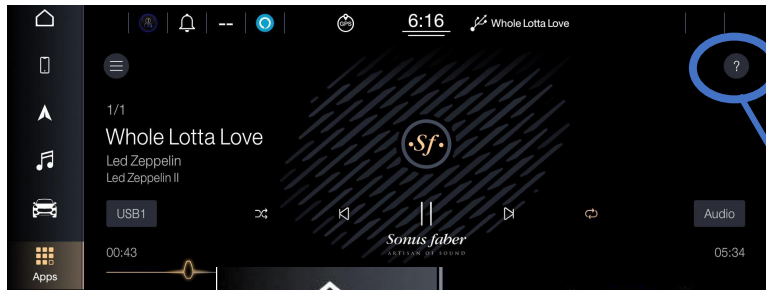

The Sonus faber app incorporates a feature that enhances your listening experience visually. By observing the screen, you will be able to "feel" the pulsations of the track you are listening to, thanks to the lights that pass through the stylized grids.

## Overview

Through this screen, it's possible to change the audio source from which the music is playing.

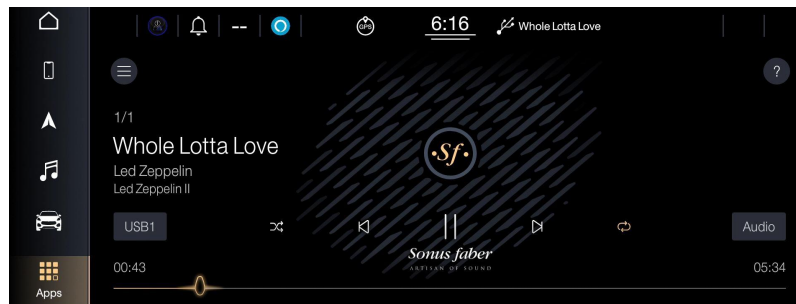

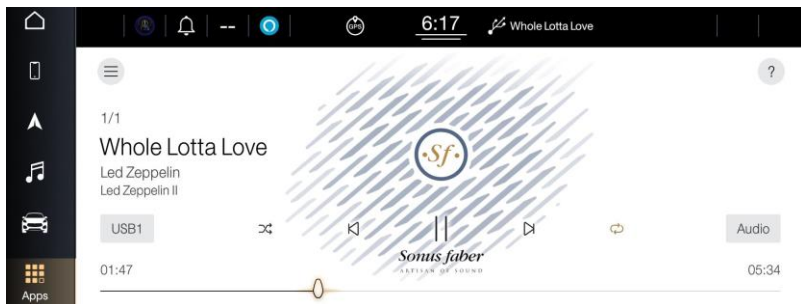

# Visualization

## Overview

Day

Night

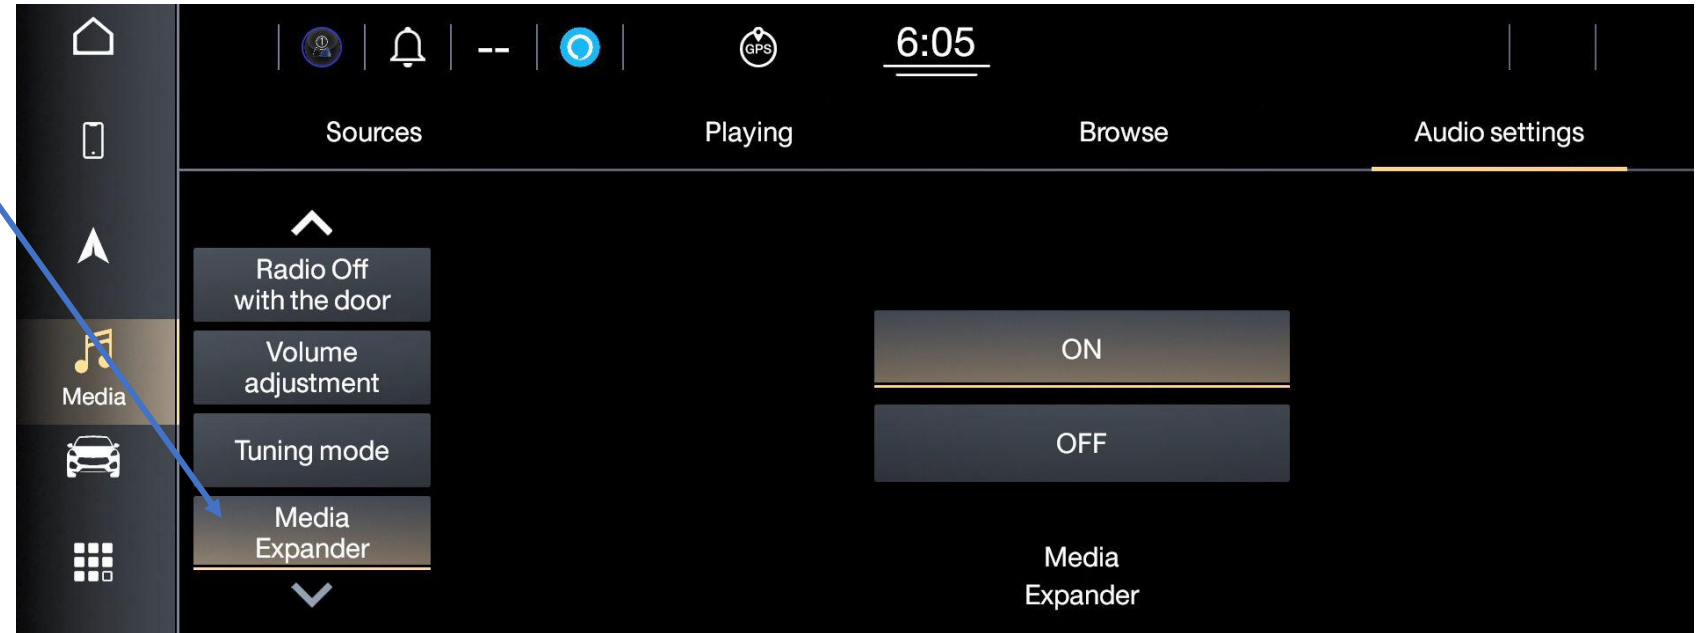

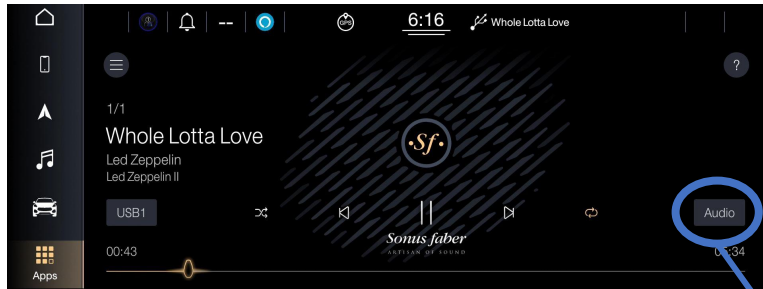

Through the Sandwich button, it's possible to change the app visualization (day or night)

# The Media Expander

## Overview

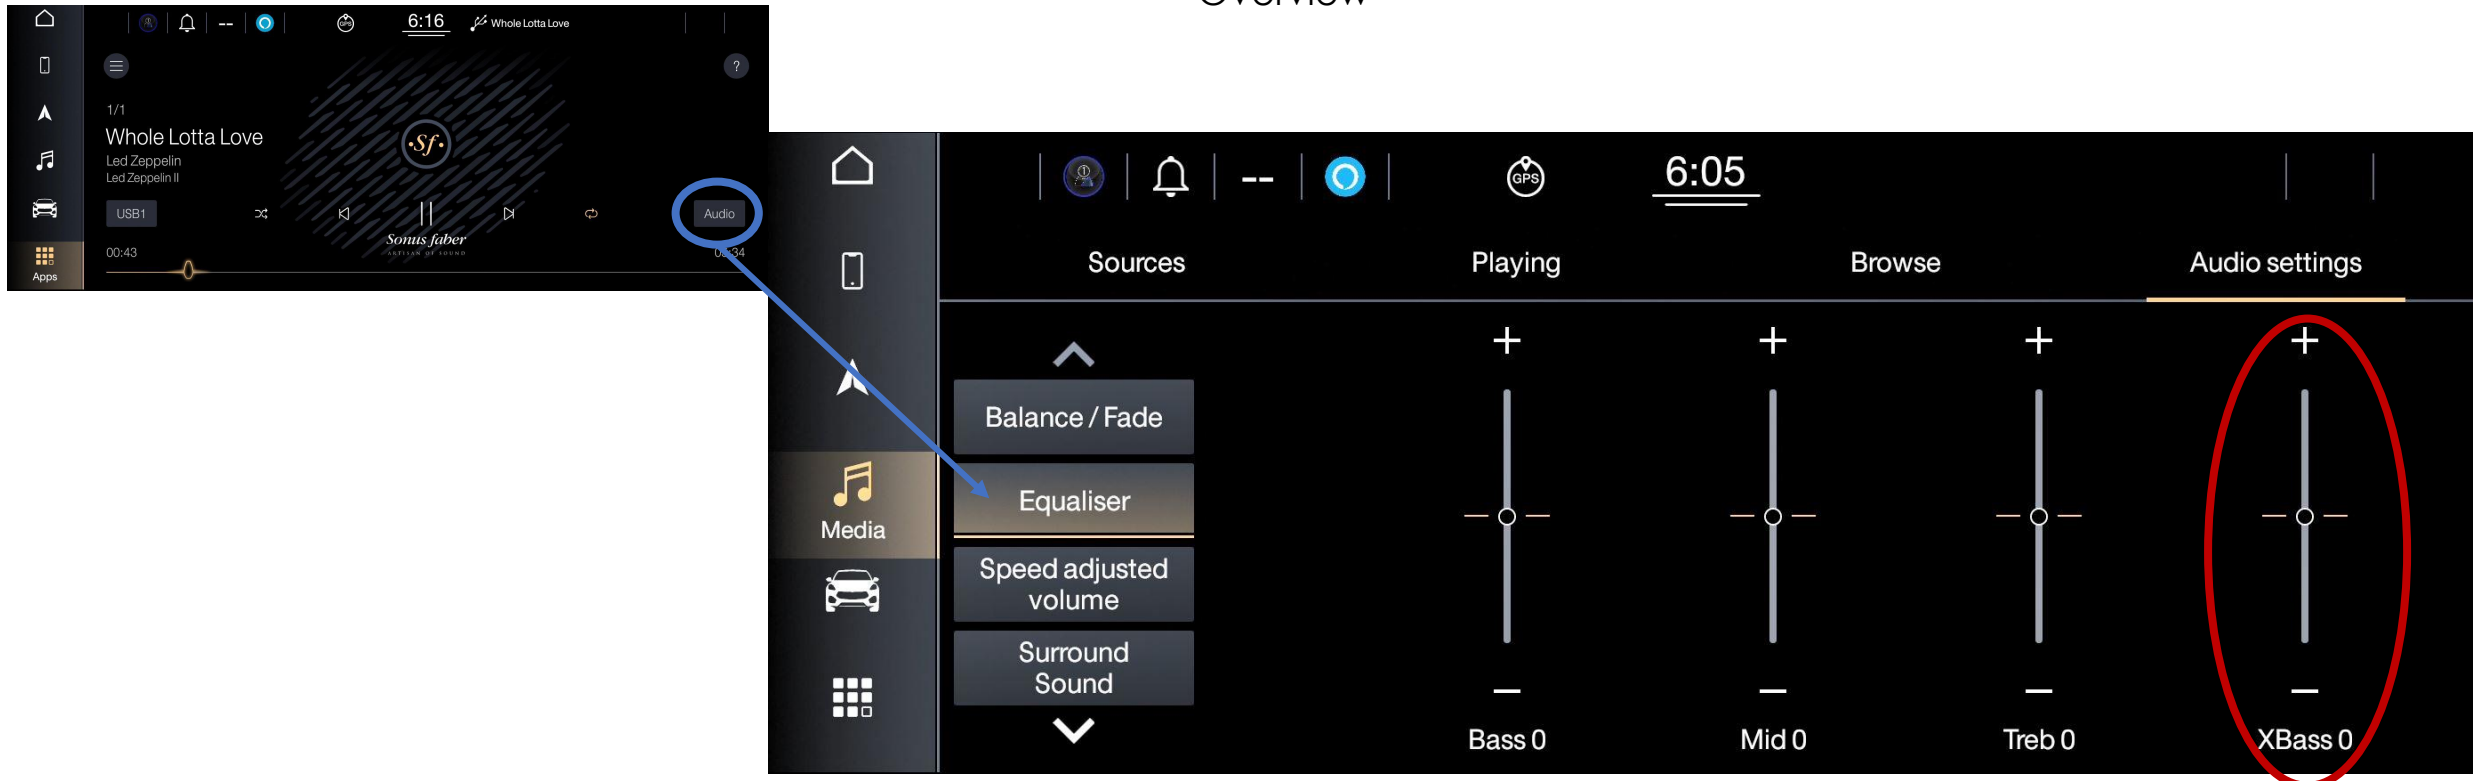

The Media Expander function is designed to enhance the quality of your music source. By using this function, any input used to play music will be processed to ensure a consistently high-quality response. The Media Expander function works by using a series of algorithms that analyze and enhance the audio signal. It focuses on expanding the dynamic range, emphasizing the details of the music, and improving the overall sound quality.

# The Equalizer

## Overview

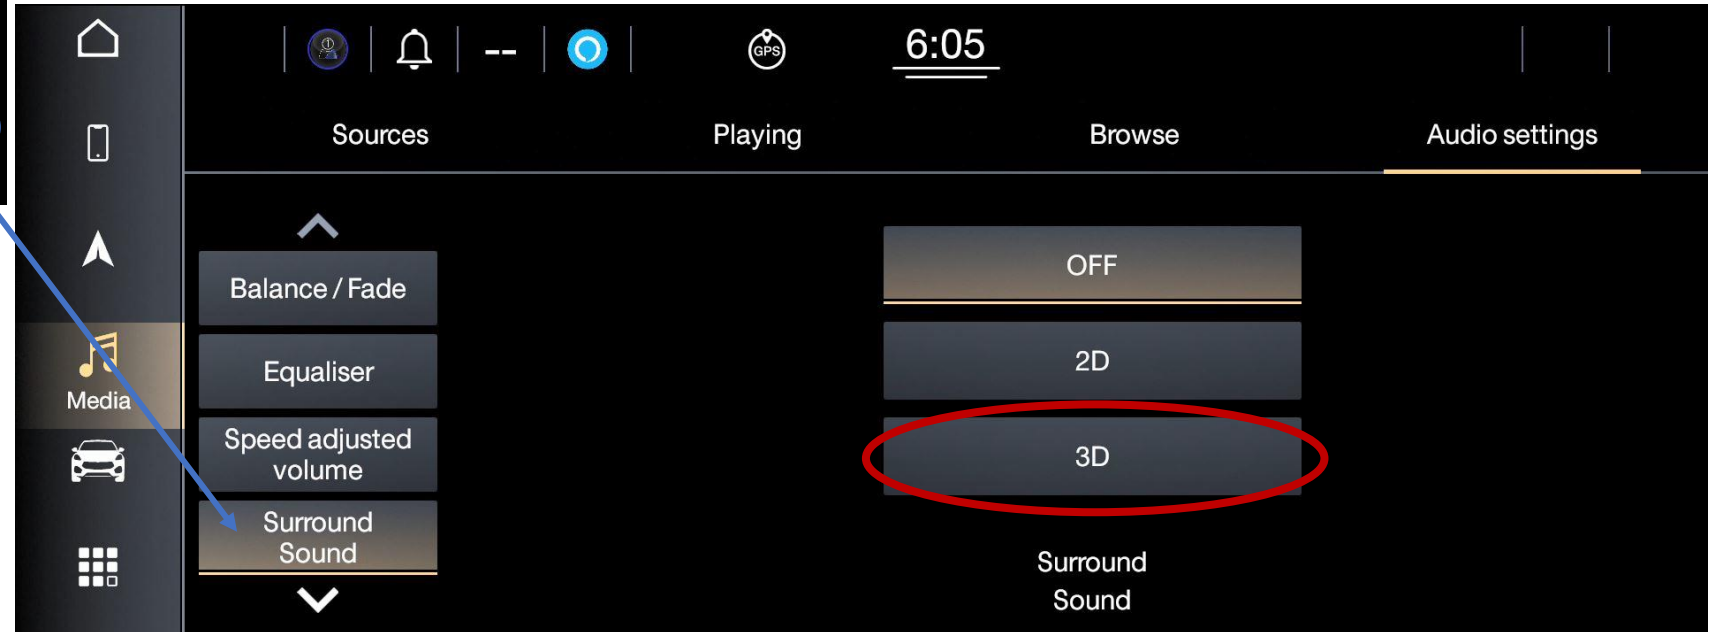

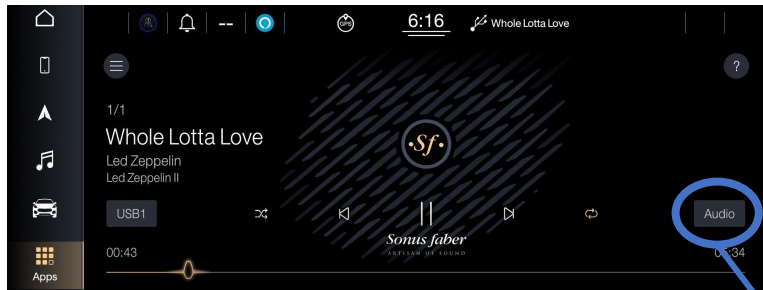

The Equalizer is a tool that allows users to adjust the various sound levels to customers liking. With equalizer, users can boost or reduce certain frequencies like bass, treble, or mid-range, ensuring that they get the perfect sound profile for their listening preferences. We suggest to maintain the levels always flat.

One additional feature found only in the optional High Premium Sonus faber Sound systems is the XBass function. While equalizer adjusts multiple frequencies of the sounds, XBass is exclusive to high premium setups and adjusts only the very low frequencies of the track played.

# The Surround

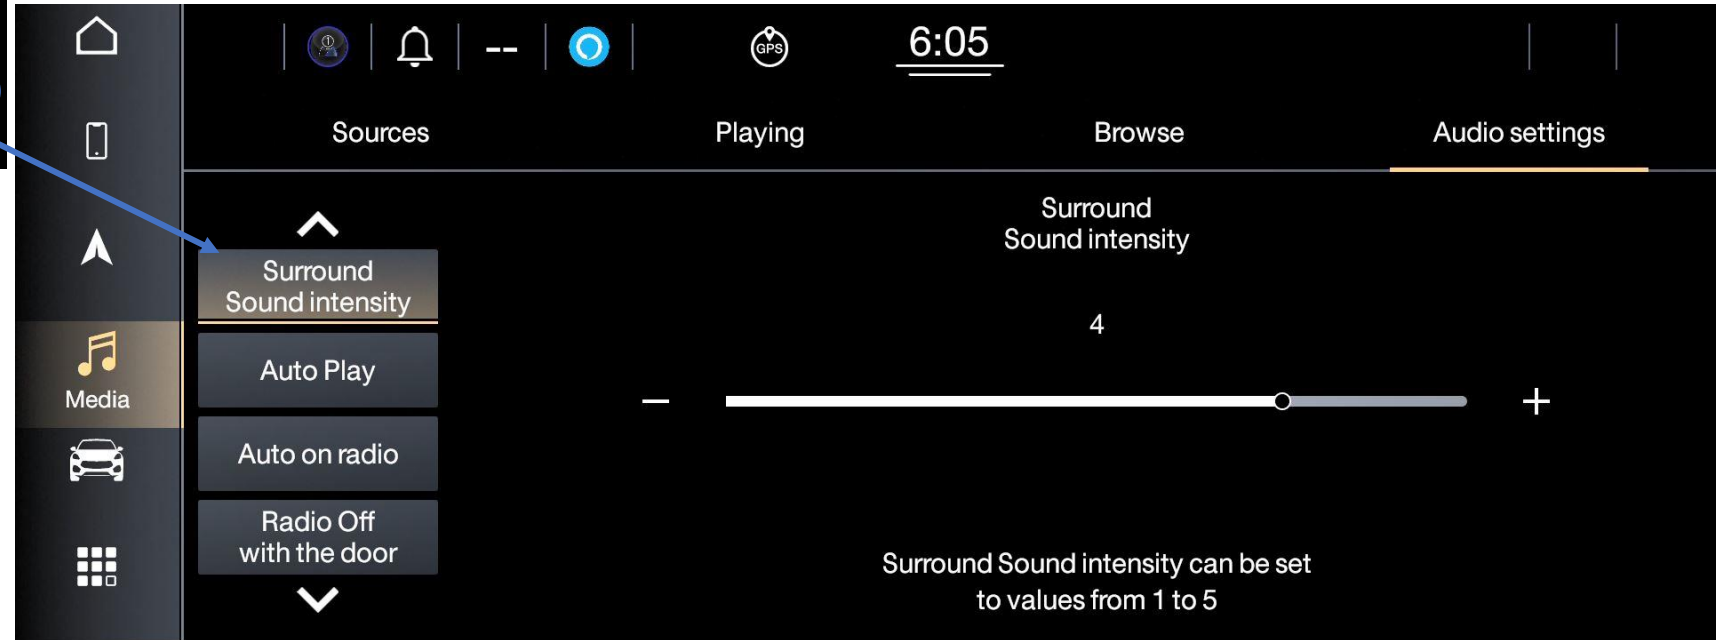

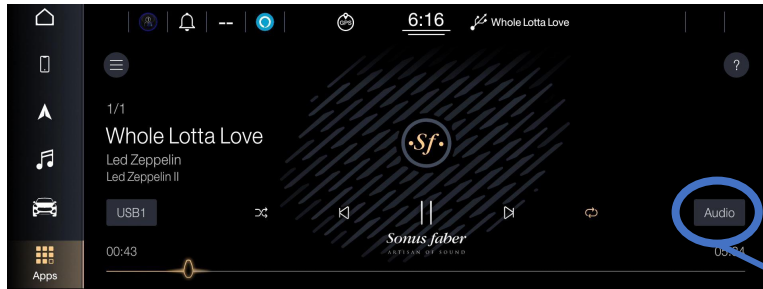

## Overview

The "Surround Sound" button allows you to switch between 2D and 3D sound options (only available on the optional High Premium Sonus faber system). The surround technology in the Sonus faber system is an algorithm that creates a widening effect of the sound space within the cabin. The 2D Surround feature provides a heightened sense of spaciousness, making the listener feel as if they are seated in a larger environment. The sound image will be perceived as being closer to the listener's head. On the other hand, with the 3D Surround, the listener will experience the sensation of being immersed in an expansive and vast environment, to the extent that the boundaries of the space seemingly vanish, including the overhead dimension.

# The Surround

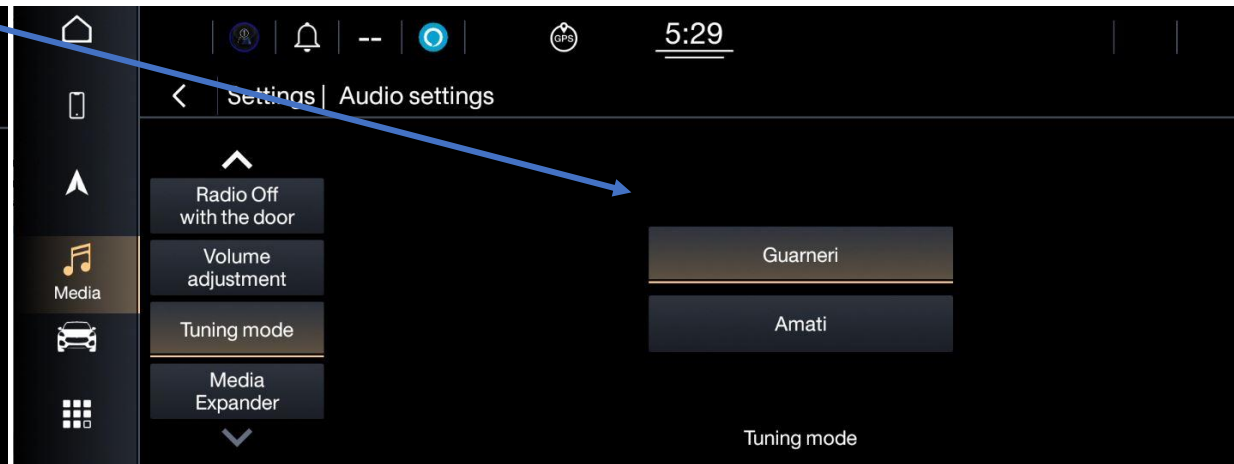

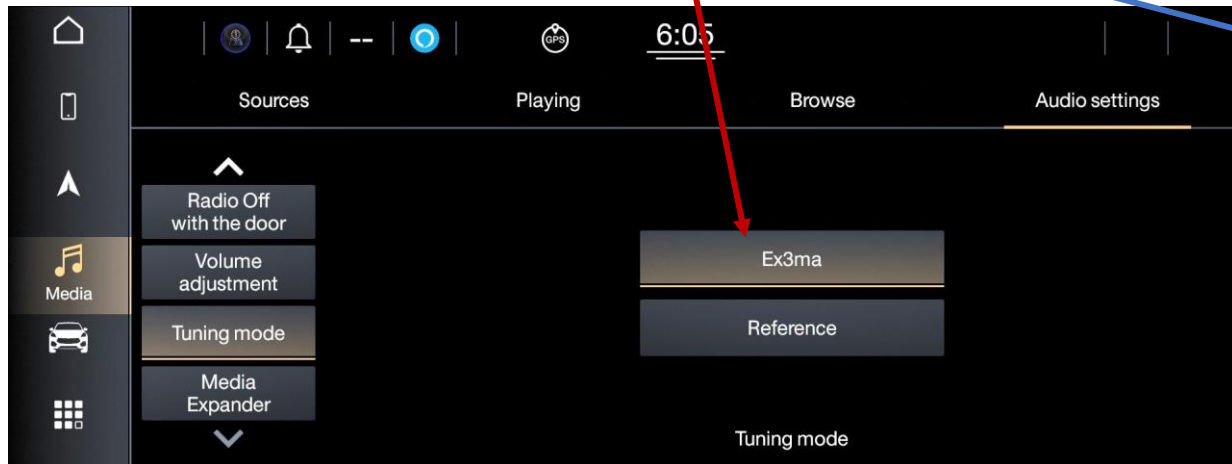

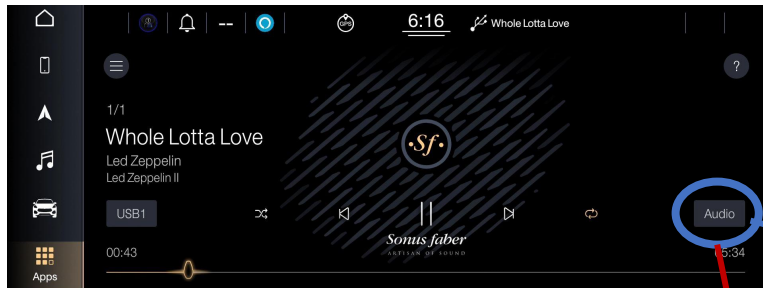

## Overview

There is also the possibility to adjust the intensity of the 3D Surround sound through the “Surround Sound Intensity” Button. This will allow the customers to tailor made the final output based on their preferences. This feature is exclusive to the High Premium Sound system, as it is the only one that offers the 3D Surround capability.

# The Tunings

## Overview

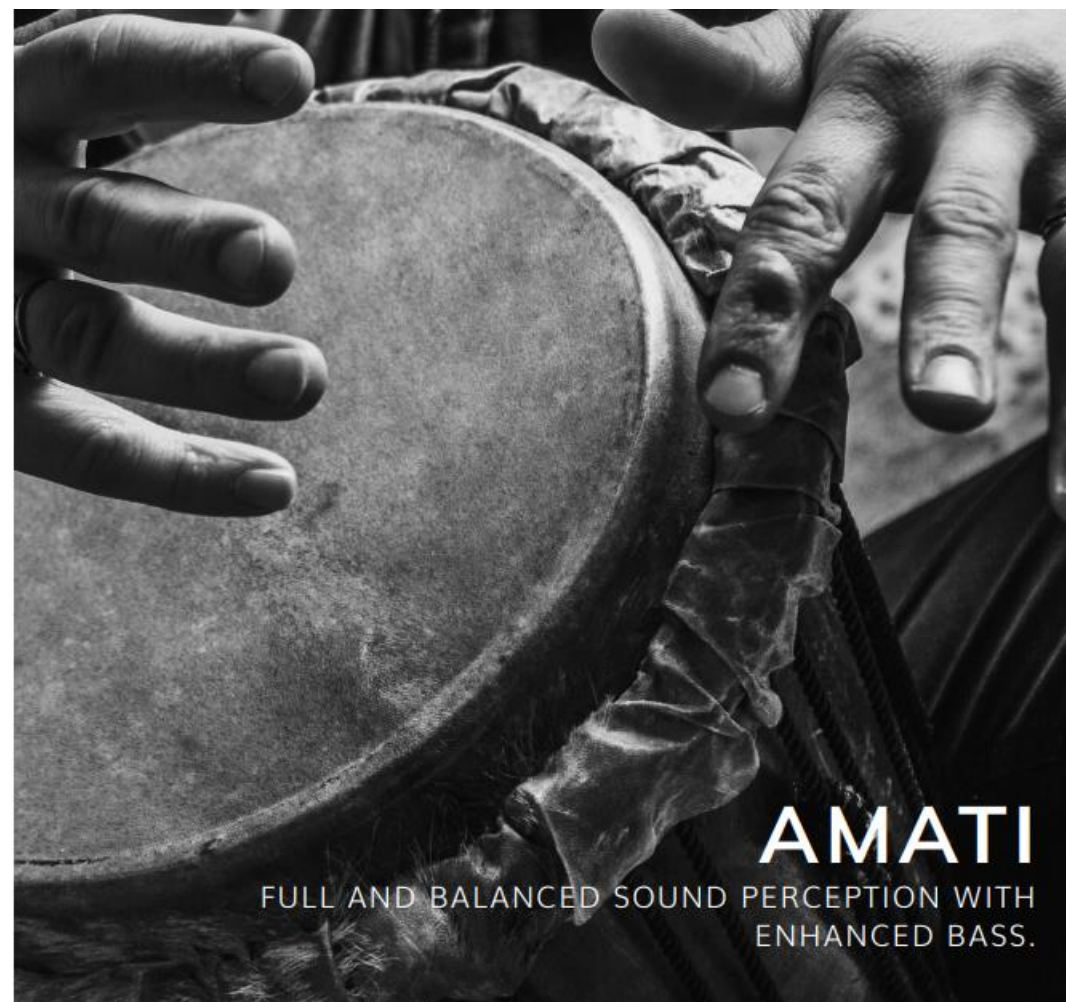

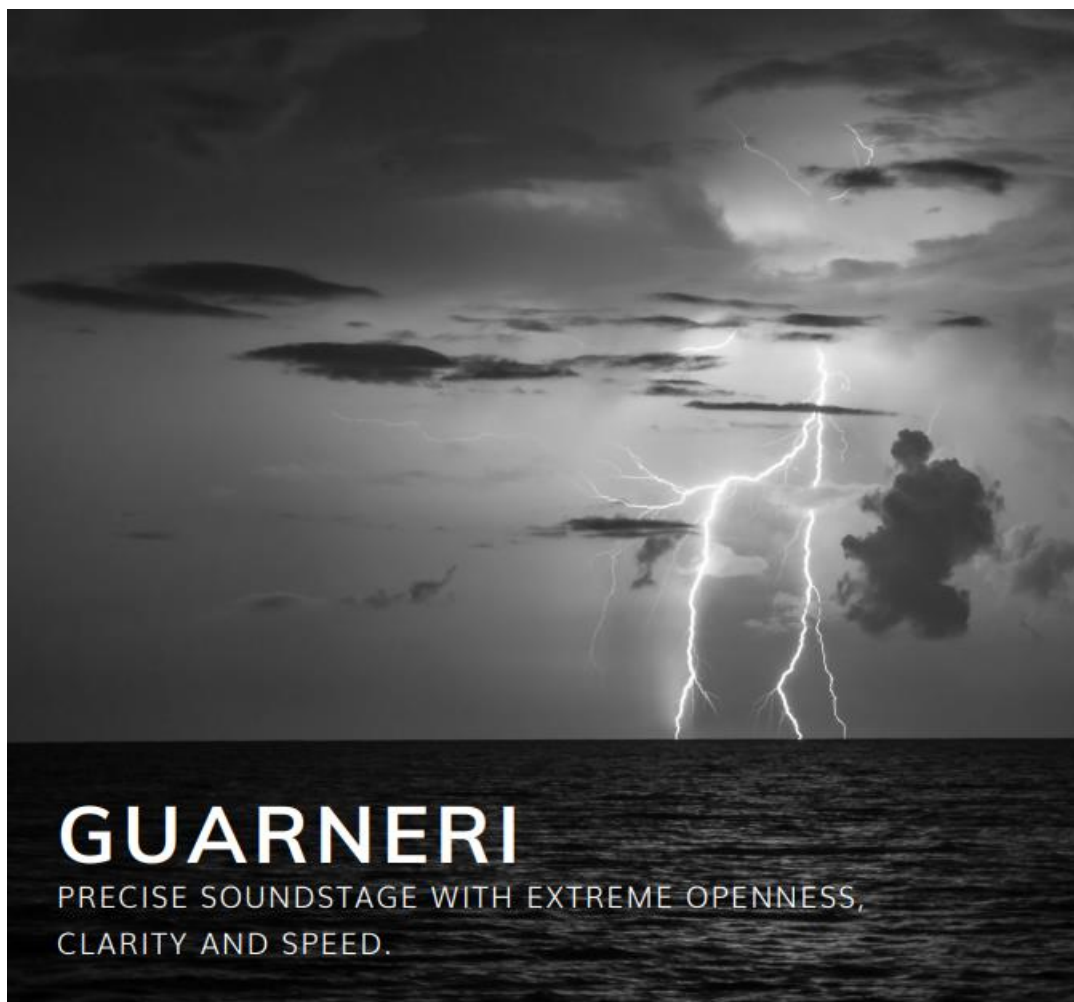

In our Sonus faber audio systems, we have included two preset tunings that allow users to customize their sound signature according to their preferences. In the Premium system, you can find the Guarneri and Amati tunings, while the High Premium system offers the Ex3ma and Reference options. These tuning names and settings are inspired by some of our most important collections.
